Amendment to the Claims:

Listing of Claims:

1. (Previously presented) An apparatus for testing equipment located in a local environment by presenting a detectable indicator gas therein, said apparatus comprising:

a one-piece, polymeric pump and container portion combination;

a chemical substance stored in said container portion, said substance being reactive with the local environment;

wherein said pump is operable to draw air into said container portion and in contact with said chemical substance to generate a detectable indicator gas, wherein said pump is integrally formed as one piece, and joined seamlessly, with said container portion such that said pump and said container portion are in fluid communication and define an internal environment that includes said chemical substance and is sealed from the local environment; and

an outlet to said container that is severable to direct said indicator gas into the local environment.

- 2. (Original) The testing apparatus of claim 1, wherein said pump is a manually squeezable bulb.
- 3. (Original) The testing apparatus of claim 1, wherein said pump is selected from the group of manually operable pumps consisting of: a manually squeezable bulb, a bellows-driven pump, a syringe, and combinations thereof.
 - 4. (Canceled)
- 5. (Original) The testing apparatus of claim 1, wherein said container portion and said pump are formed from a plastic material.
- 6. (Original) The testing apparatus of claim 5, wherein said plastic material is low density polyethylene.

- 7. (Original) The testing apparatus of claim 1, wherein said container portion is formed from a first material and said pump is formed from a second material distinct from said first material.
- 8. (Previously presented) The testing apparatus of claim 1, wherein said container portion and said pump are formed from a laminate of at least a first material layer and a second material layer distinct from said first material layer, said first material layer having a polymeric material and said second layer being a material layer that is substantially more impermeable than said polymeric layer,

wherein said second material layer completely encases said first material layer, said container portion, and said pump.

- 9. (Original) The testing apparatus of claim 1, wherein said container portion and said pump form a substantially permanent molded structure.
- 10. (Original) The testing apparatus of claim 1, wherein said chemical substance is reactive with the container environment, upon operation of the pump, to generate said indicator gas.
- 11. (Original) The testing apparatus of claim 1, wherein said chemical substance is selected such that said chemical substance and air drawn into said container portion generate a scented indicator gas upon contact.
- 12. (Original) The testing apparatus of claim 1, wherein said chemical substance is reactive with air to produce an irritant gas.
- 13. (Original) The testing apparatus of claim 12, wherein said chemical substance is liquid SnCl₄ and said indicator gas is an acid vapor fume.
- 14. (Original) The testing apparatus of claim 1, wherein said chemical substance is reactive with the container environment, upon operation of the pump, to generate a visually detectable indicator gas.
- 15. (Original) The testing apparatus of claim 1, wherein said pump has a hole to allow finger release of pressure.

- 16. (Original) The testing apparatus of claim 1, further comprising an exterior layer of laminate that seals the container.
 - 17. (Canceled)
 - 18. (Canceled)
 - 19. (Canceled)
 - 20. (Canceled)
 - 21. (Canceled)
- 22. (Previously presented) A method of testing equipment in a local environment by presenting a detectable indicator gas therein, said method comprising the steps of:

storing a chemical substance, reactive with air to produce an indicator gas, in a container formed substantially from a polymeric material;

providing a polymeric squeeze bulb device in operative communication with the container, and formed integrally, as one piece, and seamlessly joined, therewith, such that the squeeze bulb device and the container are in fluid communication and define an internal environment that is sealed from the local environment;

breaking a portion of the container tube to provide an outlet;

operating the squeeze bulb to draw air past the chemical substance to produce a human detectable indicator gas;

directing the indicator gas outward of the container and into the local environment; and

detecting the indicator to determine the operability of the equipment in the local environment.

- 23. (Original) The method of claim 22, wherein the indicator gas is a visually observable gas, said detecting step including visually observing the behavior of the indicator gas in the local environment.
- 24. (Original) The method of claim 23, wherein said observing step includes visually observing the flow of the indicator gas in the local environment.
- 25. (Original) The method of claim 22, wherein the chemical substance is liquid SnCl₄ or H₂SO₄ and said step of operating the squeeze bulb generates a chemical reaction producing an irritant indicator gas.
- 26. (Original) The method of claim 22, wherein the indicator gas is indicator gas having a pre-selected scent, said observing step including detecting the scent of the indicator gas to determine the operability of the equipment.
 - 27. (Canceled)
 - 28. (Canceled)
 - 29. (Canceled)
 - 30. (Canceled)
 - 31. (Canceled)

32. (Previously presented) A method of manufacturing an apparatus for testing equipment in a local environment by presenting a detectable indicator gas therein, said method comprising the steps of:

providing a flexible material;

providing a second material;

integrally forming, as one piece, a container portion and a squeeze bulb portion using the flexible material and applying the second material adjacent the flexible material to form a laminate therewith such that the laminate is substantially less permeable than the flexible material; and

storing a chemical substance in the container portion such that upon operation of the bulb to draw air into the container portion, a detectable indicator gas is generated for presentation into the local environment, whereby the container portion and the pump are in fluid communication and define an internal environment that includes a chemical substance and is sealed from the local environment.

- 33. (Previously presented) The method of claim 32, wherein said step of providing a flexible material includes providing a plastic material.
- 34. (Previously presented) The method of claim 32, further comprising the step of sealing a breakable end tip of the container tube portion located opposite the squeeze bulb.
- 35. (Previously presented) The method of claim 32, wherein the step of storing includes storing a chemical that, when contacted by air drawn into the container portion, generates a visually detectable indicator gas.

36. (Previously presented) An apparatus for testing equipment located in a local environment by presenting a detectable indicator gas therein, said apparatus comprising:

a one-piece polymeric pump and container portion combination defining a sealed internal environment;

a chemical substance stored in said container portion,

wherein said pump is operable to draw air into said container and in contact with said chemical substance to generate a detectable indicator gas; and

a severable outlet to said container for directing said indicator gas into the local environment;

wherein said container portion and said pump are formed from a laminate of at least a first material layer and a second material layer distinct from said first material layer.

- 37. (Previously presented) The apparatus of claim 36, wherein said pump is a manually squeezable bulb.
- 38. (Previously presented) The apparatus of claim 36, wherein said pump is selected from the group of manually operable pumps consisting of: a manually squeezable bulb, a bellows-driven pump, a syringe, and combinations thereof.
- 39. (Previously presented) The apparatus of claim 36, wherein said pump is joined seamlessly with said container portion.
- 40. (Previously presented) The apparatus of claim 36, wherein said container portion and said pump are formed form a plastic material.

- 41. (Previously presented) The apparatus of claim 40, wherein said plastic material is low density polyethylene.
- 42. (Previously presented) The apparatus of claim 36, wherein said container portion and said pump form a substantially permanent molded structure.
- 43. (Previously presented) The apparatus of claim 36, wherein said chemical substance is reactive with the container environment, upon operation of the pump, to generate said indicator gas.
- 44. (Previously presented) The apparatus of claim 36, wherein said chemical substance is selected such that said chemical substance and air drawn into said container portion generate a scented indicator gas upon contact.
- 45. (Previously presented) The apparatus of claim 44, wherein said chemical substance is liquid SnCl₄ and said indicator gas is an acid vapor fume.
- 46. (Previously presented) The apparatus of claim 36, wherein said chemical substance is reactive with the container environment, upon operation of the pump, to generate a visually detectable indicator gas.
- 47. (Previously presented) The apparatus of claim 36, wherein said pump has a hole to allow finger release of pressure.
- 48. (Previously presented) The apparatus of claim 36, wherein said second material layer seals said container.
- 49. (Previously presented) The apparatus of claim 36, wherein said second material layer completely surrounds said testing apparatus.
- 50. (Previously presented) The apparatus of claim 49, wherein said second material layer is a mylar bag.
- 51. (Previously presented) The apparatus of claim 36, wherein said second material layer is sealably disposed about said pump and said container portion.

52. (Previously presented) A method of manufacturing an apparatus for testing equipment in a local environment by presenting a detectable indicator gas therein, said method comprising the steps of:

providing a first material having one or more physically advantageous properties;

providing a second material distinct from said first material and the second material having one or more physically advantageous properties;

integrally forming, as one piece, a container portion and a pump portion using the first material and applying the second material adjacent the first material and completely encasing the first material, container portion, and pump portion to form a laminate therewith such that the apparatus is characterized by the physically advantageous properties of the first material and the second material; and

storing a chemical substance in the container portion such that, upon operation of the bulb to draw air into the container portion, a detectable indicator gas is generated for presentation into the local environment;

wherein the first material is a polymeric material;

wherein said step of providing a first material includes selecting one or more physically advantageous properties selected from the group of physically advantageous properties including: flexibility, durability, high strength, tear resistance, and combinations thereof;

wherein said step of providing a second material includes selecting one or more physically advantageous properties selected from the group of physically advantageous properties including: low permeability, inertness, non-reactive with the chemical substance, and combinations thereof; and

wherein said step of storing includes storing a chemical that, when contacted by air drawn into the container portion, generates a visually detectable indicator gas.

57. (Previously presented) The method of claim 52, wherein said step of providing a second material includes providing a mylar material.

58. (Currently amended) A method of manufacturing an apparatus for testing equipment in a local environment by presenting a detectable indicator gas therein, said method comprising the steps of:

providing a testing device including the steps of:

providing a container portion,

storing a chemical substance in said container portion, and

using a polymeric material, integrally forming a squeeze bulb as one-piece with the container portion, such that the squeeze bulb is operable to draw air into the container portion to generate a reaction between the chemical substance and the air, and to produce a detectable indicator gas; and

surrounding the testing device with a packaging layer, the packaging layer being substantially [[more]] liquid and gas impermeable than the polymeric layer.

- 59. (Previously presented) The method of claim 58, wherein the packaging layer is a mylar material.
- 60. (Previously presented) The method of claim 58, wherein the polymeric material is low density polyethylene.
- 61. (Previously presented) The method of claim 60, wherein the packaging layer is substantially less permeable than the polymeric material, such that the step of surrounding the testing device substantially reduces the permeability of the testing device.
